Environment and Climate

1. Introduction

Our vision is to be unbeatable as a leader in sustainable development within our industry. We achieve this by, for example, integrating environmental and climate work in our operations.

2. Purpose, goals and scope

The purpose of this guideline is to create conditions for systematic environmental and climate work aimed at reducing environmental and climate impact in our own operations and in our value chain.

This guideline covers climate impact, pollution to water, air, soil, and water, biodiversity and ecosystems, resource use and waste, as well as other environmental issues that may arise.

3. Target group

The guideline applies to all employees at Alligo. All employees have a responsibility to stay updated on the current version.

4. Systematic work

We take responsibility for our environmental and climate impact from a life cycle perspective. Our environmental and climate work should lead to reducing negative environmental and climate impact, increasing resource efficiency, and phasing out environmentally and health hazardous substances in our operations, products, and services, as well as in our value chain.

We work with a long-term and systematic approach, where our management system serves as the platform for our work.

We adhere to applicable laws and stay informed about new legislation and its impact on our operations. Environmental accidents and incidents are to be reported. Reported occurrences are addressed and investigated as part of continuous improvement work.

We continuously evaluate environmental and climate-related risks and opportunities¹, focusing our efforts on what is most significant.

We set measurable and time-bound goals and communicate our results transparently.

5. Own operations

We aim to minimize our negative environmental and climate impact by:

- collaborating with our customers and other stakeholders,
- considering environmental and climate risks and opportunities throughout the value chain in investments, procurement, and projects,
- systematically working to reduce the need for energy and using renewable energy where possible,
- working to reduce our negative environmental and climate impact from business travel,
- preventing the generation of waste. Where possible, there should be opportunities for reuse and recycling,
- increasing awareness among our employees about our environmental and climate impact through information and training,
- ensuring that routines are available and communicated to ensure compliance with applicable environmental laws.

6. Our products and services

We aim to minimize our negative environmental and climate impact by:

- making conscious choices regarding raw materials, production, and freight transport,
- working to reduce the environmental and climate footprint associated with the use of our products and services,
- promoting reuse, recycling, and efficient waste management of our products,
- setting requirements for and monitoring our suppliers,
- providing clear information to our customers to assist them in making more sustainable choices.

7. Publication

The latest updated version of this guideline is available on Alligo's intranet, in the management system, and on our website. The Head of Business Development and Sustainability is responsible for updating the guideline in case of changes, and it is reviewed annually. The guideline is approved by the management team.

¹ Environmental and climate-related risks and opportunities can also be referred to as environmental aspects.
